

API Documentation

This document explains the main REST APIs used in the RBAC Project and Task Management System. The APIs are designed around authentication, team management, task management, dashboard statistics, and trash management.

Base URL

`http://localhost:8800/api`

Authentication

The application uses JWT-based authentication. After successful login, the backend stores the token in an HTTP-only cookie. Protected APIs require this cookie to be present in the request.

User APIs

Action	Method	Endpoint	Purpose
Register user	POST	/user/register	Creates a new team member or admin user.
Login user	POST	/user/login	Authenticates a user and sets the JWT cookie.
Logout user	POST	/user/logout	Clears the authentication cookie.
Get team	GET	/user/get-team	Returns all team members.
Update profile	PUT	/user/profile	Updates user profile information.
Activate or disable user	PUT	/user/:id	Changes active status of a user.
Delete user	DELETE	/user/:id	Permanently removes a user.

User API Examples

Register User

`POST /api/user/register`

```
{
  "name": "Rahul Sharma",
  "email": "rahul@test.com",
  "password": "123456",
  "role": "Project Manager",
  "title": "Project Manager",
  "isAdmin": false
}
```

Login User

`POST /api/user/login`

```
{
  "email": "admin@test.com",
  "password": "123456"
}
```

Task APIs

Action	Method	Endpoint	Purpose
Create task	POST	/task/create	Creates and assigns a task.
Get all tasks	GET	/task	Returns all active tasks.
Filter tasks	GET	/task?stage=todo	Returns tasks by status.
Get trashed tasks	GET	/task?isTrashed=true	Returns tasks moved to trash.
Get one task	GET	/task/:id	Returns task details.
Update task	PUT	/task/update/:id	Updates task data.
Move task to trash	PUT	/task/:id	Marks task as trashed.
Restore task	DELETE	/task/delete-restore/:id?actionType=restore	Restores a trashed task.
Delete task permanently	DELETE	/task/delete-restore/:id?actionType=delete	Deletes a task permanently.
Dashboard statistics	GET	/task/dashboard	Returns live dashboard data.

Task API Example

```
POST /api/task/create
```

```
{
  "title": "Implement JWT Authentication and RBAC",
  "team": ["user_id"],
  "stage": "TODO",
  "date": "2026-06-08",
  "priority": "HIGH",
  "assets": []
}
```

Dashboard API

The dashboard API returns total tasks, grouped task counts, recent tasks, active users, and priority-based chart data. This is used by the dashboard page to show live statistics.

```
GET /api/task/dashboard
```

Demo Credentials

```
Email: admin@test.com
Password: 123456
```

Notes for Reviewers

- Most task and team APIs are protected and require login.
- Admin-only actions include user management and task creation.
- The current version uses MongoDB collections for users, tasks, notifications, and related data.
- The API structure is ready to be extended with project, work log, audit log, and notification modules.
